

ACCESSION NO: AF5024901

elasticity. It was found that the magnitude of the "equilibrium" elasticity
 depends on the nature of the principal monomer, its molecular
 weight, number of single bonds along the chain, the nature of the cross-linking
 agent, and the molar content of the latter. The softening point of the copoly-
 mers is a direct linear function of \bar{M} . Possible structures for these materials,
 based on the information of their chemical composition, are discussed. Compara-
 tions are made with the properties of crystalline lattices with effective number
 of bonds per unit cell. The results are presented in figures and tables.

TITLE: Experience in Determining the Mechanical Properties of Plastics in Microspecimens

PERIODICAL: Vestnik mashinostroyeniya, 1960, No. 7, pp. 41 - 45

TEXT: A new mechanical test system for plastics, requiring specimens of only 30 to 50 g (100 times less than in the existing test methods), has been developed by Institut vysokomolekulyarnykh soedineniy AN SSSR (High-Molecular Compounds Institute of the AS USSR) in cooperation with industrial institutes. The test system includes tests for softening temperature, specific impact resistance and tension, and, for specific cases, for creep and long-time strength (Ref. 2). The specimens are disks of 10 mm in diameter and 4 or 2 mm thick, 10x10x4 and 15x10x4 mm plates, and two-lateral blades of 15 to 35 mm long, up to 4 mm wide and with 8 mm transition radii. The softening point is determined in an ИФП (IFP) apparatus (Fig. 1) developed by A.P. Aleksandrov and Yu.S. Lazurkin and built in the workshops of Institut fizicheskikh problem AN SSSR (Institute of Physical

Experience in Determining the Mechanical Properties of Plastics in Microspecimens

Problems of the AS USSR). The apparatus consists of a copper tray with eight cavities for specimens, a heater placed between the tray and the asbestos cover, a resistance thermometer of 0.1 mm nickel wire wound on mica, an asbestos-lined hood and a support with dial indicator. The thermostatic system is illustrated by a diagram (Fig. 1b). The test consists in determining the penetration depth of a needle (Fig. 2). The curve shape, as in this graph, shows the difference between a "linear" plastic, like organic glass, and "three-dimensional", like eb-onite and escapon. The softening point is easily found for the "linear" plastics, only approximately for "loosely joined" (escapon) and not at all for "firmly joined". The "IFP" test takes 4 - 8 h. Impact resistance is tested with a "Din-stat" pendulum frame described in a French source (Ref. 4) on a plate specimen; the tension test machine is shown in a diagram (Fig. 4) and is used for finding the normal modulus of elasticity, relative elongation in rupture, etc. As is known, the mechanical characteristics of plastics very considerably depend on the speed with which the load is applied, and on temperature, but there is yet no industrial machinery for determining such characteristics on "microspecimens" and the described special machine (Fig. 4) had to be built. Detailed design descrip-

Experience in Determining the Mechanical Properties of Plastics in Microspecimens

tion is given. Figure 4b shows pickups of the machine connected into a bridge fed from a "3Г-10" (ZG-10) sound generator by 6 volt current with a 5,000 cycles frequency. The bridge unbalance is proportional to the applied load and is amplified. The applied force ranges are 0 - 5 kg, 15 - 30 kg and 60 - 200 kg, the accuracy is within 1% of the limit load; the thermostatic and cryostatic system makes possible tests in a temperature range between -120 and +250°C. The elongation diagram is recorded on tape. As can be seen in two graphs (Fig. 6) where the results of tests with normal and "micro"-specimens on organic glass and ebonite are compared, the "microspecimens" show practically the same results. It is mentioned that the new test system is analogous to the tests described in Reference 1. The tests are in use since 1954. There are 6 figures and 5 references: 2 Soviet, 2 English and 1 French.

TITLE:

Answers to the Inquiry About the Test Methods of the Physical
and Mechanical Properties of Plastics

PERIODICAL:

I
Zavodskaya laboratoriya, 1960, Vol 26, Nr 1, pp 7 - 8 (USSR)

ABSTRACT:

The test method and the dynstat type apparatus (Ref 1) may be recommended for the evaluation of the brittleness of plastics. In the institute of the authors successful tests on micro-samples were carried out (Ref 2), which can be further recommended. For determining the connection of the structure of plastics and their physical and mechanical properties, the facts have to be considered: If the influence of the structure upon a certain property is to be evaluated, the characteristics of only this property may be determined. If, however, differences of two (or more) plastics are to be investigated, the thermomechanical properties must be investigated within a wide temperature range and with varying stress. Tensile strength during expansion (and bending) is only to be

Card 1/2

B010/B123

determined at a single standard deformation rate (but not load rate) which can be easily reproduced. At the same time the durability and creep is to be determined of plastics. For determining the heat resistance of plastics the upper limit of temperature of usability of finished products should be fixed and not of the plastic itself, as it depends on the purpose of usability of the finished product. Therefore, the determination technique cannot be universal. The existing apparatus for determining the heat resistance of plastics (Martens, Vick) are technically imperfect and must be substituted by new and modern constructions. The indirect evaluation method of the density determination can be regarded as simple and universal method of determining the degree of crystallization. There are 6 references, 5 of which are Soviet.

TITLE: Consideration of Time Differences in Capital Investments and
Operating Costs When Comparing Alternative Schemes for the
Construction of Power Plants

PERIODICAL: Elektrichestvo, 1959, Nr 10, pp 8-15 (USSR)

ABSTRACT: When comparing alternative schemes for the establishment of power
plants from the economic point view, it is recommended for the
time being to make such comparisons by the method of redemption
period. It should be considered here that not the total amount is
invested immediately, but within several years. The building
terms, the order of investments, and the variations of the annual
production costs are to be taken into account. The authors present
a method which takes full account of the influence exerted by
time upon the economy of the objects to be compared. The method is
based on the successive development of the principle of redemption.
Before employing formula (1) of the method of redemption period,
capital investments are to be calculated according to formulas (2)
and (4). Formula (2) yields the total building and erection costs

Card 1/2

Consideration of Time Differences in Capital Investments SOV/105-59-10-2/25
and Operating Costs When Comparing Alternative Schemes for the Construction of
Power Plants

within a given building year, while formula (4) indicates the total building costs for the time at which work has been finished. The building costs are compared with the future operating costs according to formula (1). Formula (5) is then written down. It allows for a determination of the capital investments for the object concerned according to any of the variations under discussion. Finally, formula (10) is written down. However, it holds only for the case in which each variation ensures the same energy output. Otherwise it is necessary to base calculations on formula (5). There are 4 figures and 5 Soviet references.

PERIODICAL: Standartizatsiya, 1958, Nr 3, pp 31-32 (USSR)

ABSTRACT: The author points out misinterpretations of a part of "GOST 1623-46" (the standard for screw thread gages), leading to rejects of thread gages which actually are good. The contradictory wording of Paragraph 17 and a note to Section 4 of the "GOST" are the cause of misinterpretations of the permissible deviations of the half profile angle. There are 2 figures.

PERIODICAL: Elektrichestvo, 1959, Nr 5, p 93 (USSR)

ABSTRACT: On January 13, 1959, Vladimir Borisovich Romanovskiy, Professor, Doctor of Technical Sciences, died at the age of 63. He started his activity as an engineer in the design office of the "Elektroapparat" Works in 1926. Soon he became head of the works laboratory. Since 1937, he was head of the Chair of Theoretical Electrotechnics at the Leningradskiy elektrotekhnicheskii institut svyazi im. M. A. Bonch-Bruyevicha (Leningrad Communications Electrical Engineering Institute imeni M. A. Bonch-Bruyevich). At the same time, he maintained his relations to the works where he was a counsel, chief electrical engineer and a permanent member of the technical council. He is one of the founders of the theoretical principles for the building of high-voltage apparatus. At the chair he was occupied with calculations of transition processes in electric current circuits which were also the subject of his doctoral thesis. He published more than 40 scientific papers.

TITLE:

Design of a fixture for moulding pneumatic rollers
size 1000 x 1000 x 250

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy,
mashinostroyeniye, no. 3, 1961, 83 - 87

TEXT: Pneumatic rollers are special wide tires with a very small
hub diameter (usually the width is 1 and the hub $1/4$ of the outside
diameter) designed to carry vehicles over bad terrain such as snow,
soft sand and mud. In this respect they can compete with cater-
pillar machines. Due to the large support area, small hub and low
internal pressure (0.1 to 1.0 kg/cm²) these rollers can be permit-

Design of a fixture ...

ted to deflect as much as 35 % of the profile. In the USSR testing of the rollers size 24 x 36 x 6" gave good results, but showed the need to increase the outside diameter, and the size 1000 x 1000 x 250 mm was designed. Equipment for vulcanizing ordinary tires could not be used and a new fixture had to be designed. The mounting drum for making these rollers is illustrated. It consists of 24 hollow sectors, 12 on each side, each of them is connected with the opposite sector by a plate. This drum is designed for use on machine SPD-A, on which it is fixed by means of the adaptor shown in Fig. 4.

Design of a fixture ...

Superheated water is introduced through the tube in the face of the upper half of the press-form. The principle of this design is new. To obtain circular and longitudinal grooves wire 13 is hammered on the inner surface to protrude 0.5 mm. The press-form for vulcanizing the tire is constructionally similar to that for the tube, except that the upper and the lower halves are made in two parts. There are 6 figures.

TITLE: A Method of Shoe Production (Sposob izgotovleniya obuvi)

PERIODICAL: Byulleten' izobreteniy, 1958, Nr 6, pp 134-135 (USSR)

ABSTRACT: Class 71a, 16⁰¹. Nr 113694 (590545 of 24 Jan 1958).
Submitted to the Committee for Inventions and Discoveries at the Ministers Council of USSR. A method of making shoes, with the use of ready formed blank with glued-in counters and tips, and the insole attached along the entire periphery of the blank; increasing the production rate by using elastic counters and tips and hotvulcanizing them simultaneously with the vulcanization of the sole to the lower part of the shoe.

PROCEDURE AND EXPERIMENTAL DATA																																																																																																																																																																																																																																																																																																																
<p>CA</p> <p>The use of copper slag on summer wheat. S. S. Zakharov. <i>Trudy Belorusskogo Sel'skoihoz. Inst.</i> 6, No. 30, 31-2 (1959); <i>Chem. Zvest.</i> 1960, 11, 544. — The exptl. soil was a loesslike, heavy podzol; the exptl. plant was summer wheat sown after potato, turnip or cabbage crops. The best results were obtained with a dose of 300 kg. per ha. of Cu slag used on an N-P-K base. The yield was 3103 kg. grain and 2080 kg. straw per ha. No aftereffect of the Cu slag could be detected in the subsequent crop, which was a mixt. of vetch and oats.</p> <p>M. G. THE DISTRIBUTION OF AMINO NITROGEN BETWEEN PLASMA AND ERYTHROCYTES DURING STORAGE OF PRESERVED BLOOD. S. V. ZHAROV, *J. Physiol. (C.S.S.R.)* 27, 139-42 (in English, 1972) (140). Storage of preserved blood results in a slight increase in the amino N of whole blood as compared with the initial value. In the case of erythrocytes the value is const. for 5-7 days and then decreases slightly. S. A. Kariala

Ca

Amount and distribution of glycogen in blood in experimental hyper- and hypoglycemia. S. V. Zakharenko, *Endokrinologia*, 1954, 9:11-15 (1954).—More glycogen is found in the blood cells than in the plasma. The amt. and distribution of glycogen in the blood remains unaltered in experimental hyper- and hypoglycemia. The blood glycogen concn. may vary, although the total carbohydrate metabolism near normal may not change; and vice versa, a shift in sugar metabolism may not be accompanied by a change in the glycogen concn. The detn. of blood glycogen is of doubtful diagnostic value. H. P. Brody.

Title	: The Mechanism of the Action of Insulin. Communication V. The Effect of Insulin on Blood Glucose Levels in the Dog during Electroosleep.	
Orig Pub.	: Byul. eksperiment. biol. i med., 1958, 45, No. 3, 19--22	
Abstract	: Glycemia in dogs during electroosleep remained substantially unchanged. When insulin (1--10 units/kg) was injected, hypoglycemia was noted. Electroosleep exerted no effect on the degree of hypoglycemia, but prevented the occurrence of convulsions, in spite of the fact that blood sugar was lowered to 30--40 mg% (in awake animals convulsions occurred 2--3 hours after the injection of insulin). Within 1 to 2 hours after electroosleep was terminated (5--6 hours after the injection of insulin) signs of hyperinsulinism developed, i.e., salivation, panting, adynamia; convulsions were occasionally seen.

Author : Sakharov, V., Radio Station UAZPU (YA3ΦY)

Title : Single-tube type diode-wave transmitter

Periodical : Radio 7, 25-27, July 1954

Abstract : The design of a simple, single tube VHF transmitter requiring only one vacuum tube is described. The design of the

the oscillator circuit is "inductance-coupled" with the antenna. The antenna is a simple wire antenna. The transmitter is designed for the frequency range 10-15 MHz, as well as the antenna.

TITLE: Lunar transport

SOURCE: Aviatsiya i kosmonavtika, no. 4, 1966, 28-31

TOPIC TAGS: ~~MOON. transportation equipment~~ *lunar surface equipment,*

ABSTRACT: An illustrated description of various vehicles, imagined, designed or modeled for the eventual use on the moon surface, was presented. Fig. 1 shows a four-wheel vehicle system with a steering wheel. Fig. 2 shows a four-wheel vehicle system with a steering wheel. Fig. 3 shows a four-wheel vehicle system with a steering wheel. Fig. 4 is equipped with ribbon-like flexible plates actuating the motion and protecting the vehicle from overturning. Fig. 5 shows a four-wheel motor vehicle ready to go to the moon while in Fig. 6, the preference is given to an imaginary wheelless walking design. (Orig. art. has 6 figures.)

shown in fig. 4 is equipped with ribbon-like flexible plates actuating the motion and protecting the vehicle from overturning. Fig. 5 shows a four-wheel motor vehicle ready to go to the moon while in Fig. 6, the preference is given to an imaginary wheelless walking design. (Orig. art. has 6 figures.)
